                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ò
                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                antigen HA-1 R-allele. The specification describes methods for typing alleles (preferably the H and R alleles) of the minor histocompatibility antigen HA-1 in a sample, which comprise detecting polymorphic nucleotides in the CDNA or genomic nucleic acids of the alleles. The methods can be used for HA-1 typing for bone marrow transplants, severe aplastic anaemia, leukaemia and immune deficiency diseases, as well as detection of genetic aberrances. The probes and primers of the invention can be used to screen for the HA-1 alleles. The HA-1 peptides can be used anti-idiotypic B cells and/or T cells and antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents part of the minor histocompatibility antigen HA-1 H-allele. The specification describes methods for typing alleles (preferably the H and R alleles) of the minor histocompatibility antigen HA-1 in a sample, which comprise detecting polymorphic nucleotides in the CDNA or genomic nucleic acids of the alleles. The methods can be used for HA-1 typing for bone marrow transplants, severe aplastic anaemia, leukaemia and immune deficiency diseases, as well as

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents an immunogenic peptide constituting a T-ceil epicope, obtainable from the minor histocompatibility antigen HA-i. The peptide can be used in vaccines or pharmaceutical formulations as medicines to induce tolerance for transplants so as to prevent rejection and/or Graft-versus-Host Disease, or to treat autoimmune diseases. Neoplastic haematopoietic cells presenting the peptides, in an HLA class I context, can be eliminated after specific recognition of the peptides. The peptides can also be used to raise antibodies, T-cell receptor, B- and T-cells.
detection of genetic aberrances. The probes and primers of the invention can be used to screen for the Ha-1 alleles. The Ha-1 peptides can be used anti-idictypic B cells and/or T cells and antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                        Gaps

The present sequence represents a new peptide (PI) constituting a T-cell peptide obtainable from the minor histocompatibility antigen HA-1. The peptide is immunogenic and can be used as part of a vaccine. Pl is used as a medicine, to induce tolerance for transplants, prevent rejection and/or graft versus host disease, or to treat (auto) immune diseases. In particular it can be used with bone marrow transplantation, in the treatment of severe aplastic annemia, and immune deficiency
                  Minor histocompatibility antigen; HA-1; T-cell epitope; immunological; graft versus host disease; bone marrow transplant; leukaemia; vaccine; diagnosis; aplastic anaemia; immune deficiency disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Minor histocompatibility antigen, FA-1; T-cell epitope; immunological; graft versus host disease; bone marrow transplant; leukaemia; vaccine; diagnosis; aplastic anaemia; immune deficiency disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                       A new minor histocompatibility antigen, HA-i - useful to treat immune diseases and prevent rejection and host versus graft disease in bone marrow and organ transplantation

The peptide is immunogenic and can be used as part of a vaccine. Plis used as a medicine, to induce tolerance for transplants, prevent rejection and/or graft versus host disease, or to treat (auto) immune diseases. In particular it can host disease, with home marrow transplantation, in the treatment of severe aplastic anaemia, leukaemia, and immune deficiency
                                                                                                                                                                                                                             Minor histocompatibility antigen, HA-1, T-cell epitope, immunological, graft versus host disease, bone marrow transplant, leukaomia, vaccine, diagnosis, aplastic anaemia, immune deficiency disease.

Sequences AAU71093-AAU71796 represent the 103P3E8-related protein and peptide fragments of the protein. 103P3E8 exhibits tissue specific expression in normal adult tissue, but it is also aberrantly expressed in many cancers including tumours of the prostate, bladder, kidney, colon, lung, breast, rectum and stomach. The 103P3E8 polynuciectide, its related protein and peptide fragments and specific. PGR primers are therefore useful for diagnosing and treating cancer. A vector comprising a polynuciectide which encodes a single chain monoclonal antibody, that immunospecifically binds to an 103P2E8-related protein, and a riboxyme capable of cleaving a polynuclectide having the 103P3E8 coding sequence, are both useful in the preparation of a composition for treating a
                 The 103P3E8 polynucleotide, its related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1838/88; prostate; bladder; kidney; colon; lung; breast; rectum; stomach;
lung, breast, rectum and stomach. The 103P3E8 polytuoleotide, its relate protein and peptide fragments and specific PCR primers are therefore useful for diagnosing and treating cancer. A vector comprising a polymulospecifically binds to an 103P3E8-related protein, and a ribozyme apable of Cleanying the 103P3E8 related protein, and a ribozyme are both useful in the preparation of a composition for treating a patient with a cancer that expresses 103P3E8. The sequences can be used the diagnostic methods to monitor the level of 103P3E8 gene products in serum, blood, usine and tissue and to thereby detect the presence of cancerous cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            tumcur, cancer, cytostatic, gene therapy, antibody therapy, ribozyme, gingle chaim monoclonal antibody, serum, blood, urine, tissue, human,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Monitoring 103P358 gene products in sample from patient (suspected obvying cancer, useful for diagnosing, managing or treating cancers, e.g. prostate cancer, comprises determining presence of aberrant 133P388 gene products.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human MHC molecule HLA-All binding 16323E8 peptide #35.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  10393BB; prostate; bladder; kidney; colon; lung; breast; rectum; stomach; tumour; cancer; cytostatic; gene therapy; antibody therapy; ribozyme; single chain monoclonal antibody; serum; blood; urine; tissue; human;
                                                                                                                                                                                                                                              The present sequence represents a new peptide (PI) constituting a T-cell epitope obtainable from the minor histocompatibility antigen HA-1. The peptide is immunogenic and can be used as part of a vaccine. PI is used as a medicine, to induce tolerance for transplants, prevent rejection and/or graft versus host disease, or to treat (auto) immune diseases. In particular it can be used with bone marrow transplantation, in the treatment of severe aplastic anaemia, leukaemia, and immune deficiency
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Monitoring 103P3E9 gene products in sample from patient (suspected of) having cancer, useful for diagnosing, managing or treating cancers, e.g. prostate cancer, comprises determining presence of aberrant 103P5E8 gene products.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                   A new minor histocompatibility antigen, HA-1 - useful to treat immune diseases and prevent rejection and host versus graft disease in bone marrow and organ transplantation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Afar DEH;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ..

                                                    Chlamydophila pneumoniae T-cell epitope #4 useful as Chlamydia antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to the isolation of Chlamydophila pheumoniae strain CML029 genes and their encoded proteins. The genes the invention encode an ATP binding cassette gene, a secretary locus open reading frame (ORF), an endopeptidase, a protease, a retailoprocease, (DP protease ATPase, a CLP protease subunit, a transglycolase/transpeptidase, a CLPC protease, or thioredoxin. The genes of the invention can be used in a vector as a vaccine for the prevention and treatment of Chlamydia infections. AAU09440-AAU09473 represent B- or T-ceil epitopes from the C. pneumoniae proteins (AAU09430-AAU09439) of the invention. These epitopes can be used as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Vaccine useful for immunising mammals against chlamydia infections, comprises vectors having sequences of ATP binding cassette gene, secretary locus open reading frame gene of chlamydia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ..

The present invention describes a method (M1) for the isolation of a subset of peptides from a protein peptide mixture (P1). M1 involves:

(a) separating the protein peptide mixture into fractions of peptides via chromatography, (b) chemically, or chamically and chromatography, is chromatography, or chamically and chromatography, altering at least one amino acid of at least one of the companies, in each fraction, thereby generating a subset of altered companies, or chromatography, where the chromatography of steps (a) and chromatography, where the chromatography of steps (a) and chromatography, where the chromatography of steps (a) and companies, the absence of a variation of peptides from protein peptide of mixtures. M1 can also be used in diagnostic assays for detection of the companies, the absence of a variation in expression level of a disease state. M1 can be used for identifying target proteins present in companies, the absence of a variation in expression level of a disease state. M1 can be used for identifying target proteins present in companies in cells with physicogical changes such as metabolic shift, in the admitisation of brown regulated in disease tissues, in identification of intracellular confidence in the proteins and in the identification of confidence in the identification of confidence in the identification of confidence in the identification of militarian expenses of affinity tags.

M3074714 to ABP75190 represent proteins used in the exemplification of the present invention.
                                                                                                                                                                                                                                                         Method for isolation of peptides from complex mixture of peptides involves specific chemical and/or enzymatic alteration of at least
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Proteome analysis; isolation; determination; diagnostic assay; protein marker; identification; metastatic; invasive cancer; differential expression; signalling pathway; chromatography.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a method (MI) for identifying secreted intracellular bacterial proteins (BP). MI comprises: (a) selectively visualising BP by pulse labelling in the presence of an inhibitor of eukaryotic protein synthesis followed by 2D electrophoresis and autoradiography; (b) comparing protein profiles (PF) of purified bacteria to PF of total lysate (TL) of infected cells; and (c) identifying protein spots messent in differential images from gels loaded with TL. The present sequence is one such bacterial peptide epitope which was identified by the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Proteome analysis; isolation; determination; diagnostic assay; detection; protein marker; identification; metastatic; invasive cancer; differential expression; signalling pathway; chromatography.

The present invention describes a method (M1) for the isolation of a subset of peptides from a protein peptide mixture (P1). M1 involves:

(a) separating the protein peptide mixture into fractions of peptides via chromatography. (b) themically, or enzymatically, or chemically and the peptides on a chemically generating a subset of altered peptides in each fraction, thereby generating a subset of altered peptides in a chemically and checking the altered (flagged) peptides out of each fraction via chromatography, where the chromatography of steps (c) is performed with the same type of chromatography of steps (d) is performed with the same type of chromatography of steps (d) is consistent markers or a specific set of proteins protein perform markers or a specific set of proteins indicating of a class on the absence or a variation in expression level of a class or a protein markers or a specific set of proteins proteins present in metastatic and invasive cancers, in differential expression of proteins of on metastatic and invasive cancers, in differential expression of proteins of on the identification of biomarkers in cancers and in the identification of signalling pathways. The method is geli-free methodology for the identification of signaling pathways. The method is geli-free methodology for multidainer and quantidative proteome analysis without the need for an approximation of the proteins of a feffinity tags.
                                                                                                                                                                                                                                                                                           Method for isolation of peptides from complex mixture of peptides involves specific chemical and/or enzymatic alteration of at least one
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ABP74714 to ABP75190 represent peptide sequences used in the exemplification of the present invention.

phosphostoma (Rb) interacting zinc finger (RIZ) protein is a nuclear phosphorotein that acts as a cell differentiation factor. RIZ can modulate cell growth by binding to Rb protein, which is involved in regulating cell proliferation. In addition, RIZ can act to regulate transcription. RIZ functions to maintain cells in the Gl phase of the cell cycle, by interacting with Rb through the cr2 domain of RIZ. RIZ protein is a PR domain protein and is present primarily in the cell nucleus. RIZ gene mutations may be implicated in various cancers such as melanoma, neuroblastoma, leukaemia and breast cancer, and so the RIZ gene may neuroblastoma, leukaemia and breast cancer, and so the RIZ gene may neuroblastoma, leukaemia and breast cancer, and so the RIZ gene may cated in cell cycle arrest, inhibition of RIZ activity may be useful in meurodegenerative disorder therapy e.g. for Parkinson's, Huntingdon's or Alabeimer's disease, paralysis or motor neurone disorders, or cardiac disorders e.g. heart disease, where the ability to induce neural/ cardiac used in the analysis of PR domain peptides of the present invention.

for

New PR domain peptides comprising amino acid sequences from, for example retinoblastoma-interacting zinc finger, or egi-43 proteins, regulating gene transcription and controlling cell proliferation and

```
Sequence 20, Application US/08459568
Patent No. 5811304
GERRAL INFCRMATION:
APPLICANT: Huarg, Shi
ITILE OF INVENTION: Retinoblastoma Protein Interacting
ITILE OF INVENTION: Zinc Finger Proteins
NUMBER OF SUDDENCES: 93
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0; Indeis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Dength 7;
